NEWS RELEASE

Montreal, Quebec May 8, 2007

GOLDEN TAG AND RUBICON MINERALS ANNOUNCE FOLLOW-UP DRILLING AT McCUAIG PROJECT, RED LAKE, ONTARIO

-7500 METRE PROGRAM TO COMMENCE BY EARLY JUNE-

Golden Tag Resources Ltd. (GOG:TSX-V) and joint venture partner **Rubicon Minerals Corp.** announce that they will carry out a follow-up, 7,500 metre, land based drill program beginning in late May or early June, at the McCuaig joint venture (Golden Tag 40%-Rubicon 60%). Golden Tag and Rubicon recently announced encouraging results from a drill hole designed to test for the possible down-dip extension of the No. 1 vein structure developed at the adjacent former McKenzie mine (see news release dated April 16, 2007). A gold-bearing zone in what appears to be a very robust structure, was intersected containing up to **15.65 g/t gold over 1.55 metres.**

Hosted by a well developed 20+metre wide vein zone, this target is wide open for follow up, both along strike and down dip. The project is well located within Balmer rocks on the prolific Red Lake Mine Trend and is adjacent to both the past-producing McKenzie Mine which produced 651,000 ounces of gold between 1935 and 1966, and the Gold Eagle Mines discovery to the east.

A detailed presentation on the McCuaig property including photographs of the zone are posted at the Company's website at www.goldentag.ca

In other news, drilling on the San Diego property in Durango State, Mexico where Golden Tag is earning a 50% interest from ECU Silver Mining Inc. is nearing completion on Holes P2, P3 and P4 (see news release of April 18, 2007). These holes, comprising a total of 1,253 metres, are in the northwest sector of the property and are testing the lateral extension of strong mineralization in the La Rata and La Cruz veins.

The Company has completed drilling on the Aquilon properties in James Bay, Quebec. Drilling on the Extension property confirms that the banded iron formation (“BIF”) consists of banded magnetite-chert with interlayers of garnet, amphibole and biotite. Positive signs of sulphide replacement of magnetite were observed in several holes, however, assay results to date are at background levels only. On the Aquilon Main property, 5 holes for 1,000 metres have been completed. Several disseminated to semi-massive sulphide, largely pyrotite zones were encountered within metasediments. The Company is awaiting assay results.

Golden Tag Resources Ltd. is a junior exploration company actively exploring for high grade gold and silver deposits at the San Diego silver project in Durango State, Mexico; the Aquilon Main and Aquilon Extension gold projects in James Bay, Quebec; and the McCuaig gold project in Red Lake, Ontario.
